Nebrilysin degrades both amyloid beta peptides 1-40 and 1-42 most
rapidly and efficiently among thiorphan- and
phosphoramidon-sensitive endopeptidases

NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft" sequence. It currently consists of 56 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
Estimated insert size: 155965; sum-of-contigs estimation Quality coverage: 0x in Q20 bases; agarose-fp estimation Quality coverage: 2.2x in Q20 bases; sum-of-contigs estimation

NOTE: This is a 'working draft' sequence. It currently consists of 78 contigs. The true order of the pleces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N. but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
                                                NOTE: Estimated insert size may differ from sequence length

                                                                                                                                                                                                                                                                                                                                                                       * NOTE: This is a 'working draft' sequence. It currently consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as * runs of N, but the exact sizes of the apps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will * be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Length 208249;

ò a consists of 75 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

```
This sequence was finished as follows unless otherwise noted: all regions were either double stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Bm:, EMBL; Sw:, GARSEROT: Tr:, TREMBL; WP:, WORMPEP: Information on the WORMPEP database can be found at
variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.
                                                                                                                                                                                                                                                                                                                                                                                                      http://www.sanger.ac.uk/HGP/Chr10
RP11-69C17 is from the library RPCI-11.1 constructed by the group
of Pieter de Jong. For further details see
                                                                                                                                                                                                                                                                                                          http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 10, constructed by the Sanger Centre Chromosome 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence is the entire insert of clone RPI1-69C17 The true left end of clone RPI1-35D13 is at 91113 in this sequence. The true right end of clone RPI1-35BN3 is at 80918 in this sequence. Location/Qualifiers.

                                                                                                                                                                                                                                                                                                                                                           Sequences AA228811-228827 represent probes for detecting the rat membrane metalloprotease designated neprilysine II (NEPII) gene (AA228810). NEPII is involved in (in)activation of neuronal and hormonal peptide messengers. NEPII is used to screen for specific substrates (used to detect NEPII in cells and tissues) or inhibitors, which can also be used to detect NEPII or for treatment of disorders related to peptidergic signalling in which NEPII in involved, e.g. cardiovascular or neurodegenerative diseases; growth disorders of endocrine origin; disturbances of the hypothalamic- hypophyseal axis or endocrine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             secreted endopeptidase which is useful for treating sexual dysfunction, for e.g. male erectile dysfunction or female sexual dysfunction such as
                                                                                                                                                                                                                                                                                                                                                                                                                                          analgesic;

NEPII is used to screen for specific substrates (used to detect NEPII in cells and tissues) or inhibitors, which can also be used to detect NEPII or for treatment of disorders related to peptidergic signalling in which NEPII in involved, e.g. cardiovascular or neurodegenerative diseases; growth disorders of endocrine origin; disturbances of the hypothalamic-hypophyseal axis or
                                                                                                                                                              (e.g. female sexual arousal disorder (FSAD)). The SEP polypeptides are also useful for treating the above disorders and other disorders such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          metalloprotease
encoding a human soluble secreted endopeptidase (SEP). The anti-SEP antibody and the compound which inhibits or selectively inhibits the human SEP protein are useful in the manufacture of a medicament for the prophylaxis and/or treatment of sexual dysfunction, in particular male erectile dysfunction (MED) or female sexual dysfunction (FSD)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence encodes a murine neutral endopeptidase metallopeptidase-like enzyme, designated NL-1. The specification also describes NL-2 and NL-3. The NL enzymes are used to test for specific inhibitors. The N-terminal region of the enzymes can be used to promote production and secretion of foreign proteins and active biopeptides, using chimmeric constructs containing the foreign protein downstream from and in phase with the N-terminal region. The NL enzymes are have been localised to the brain, and may be useful in the

Nt enzymes have also been localised to the testis and ovaries, and may be used to control fertility. They have also been localised to bones, and may be used to treat bone diseases, and abnormal phosphate metabolisms related to improper peptide

polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  polymorphic variants of proteins (AAG98010-AAG98238) related to anglopoletin, 4-hydroxybutyrate, dehydrogenase, adenosine triphosphate (ATP) dependent RNA heliacase, major historompathility complex (MHC) class I historompathility antigen and/or phosphoglycerate kinase. These nucleic acid single nucleotide polymorphisms (SNPs) and the encoded antirheumatic, have potential immunosuppressive, immunostimulatory, cytostatic, antirheumatic, antisclerotic, antidiabetic, antinilammatory, cytostatic, antileukemic, neuroprotective and antimicrobial activity and may be useful in gene/protein therapy, vaccines, modulation of the expression and activity of proteins related to angiopoletin, 4-hydroxybutyrate, dehydrogenase, adenosine triphosphate (ATP)-dependent RNA halicase, major histocompatibility complex (MHC) class I histocompatibility antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      histocompatibility antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     erytheromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, leukemia), diseases of the nervous system, an infection of pathogenic organisms. They may also be used to alter phenotypic traits such as longevity, appearance,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polymorphic nucleic acids encoding e.g. anglopoietin, dehydrogenase, adenosine triphosphate-dependent RNA helicase and/or phosphoglycerate kinase, useful for diagnosing and treating, e.g. cancer, autoimmune

RNA was isolated from peripheral lymphocytes and converted to cDNA using a C-beta-specific primer. The CDNA was amplified by anchored PCR using C-beta and polyc primers, then amplified again using a different C-beta specific primer. The amplified product was Saciir restricted, inserted into Bluescript SK+ vector and used to transform F.coll XL-lblue. Transformants were screened with a C-beta specific probe and DNA from positive clones was sequenced in the C-beta region. The sequence designated "IGR D 04" is a consensus sequence from 4 distinct cDNA clones, as was seen at position 154 in place of a A and an A at position 160 instead of a G. The sequence has an homology of 75.7% with the sequence VB12A1 (see Leiden J.M., et
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                11., Proc.Natl. Acad. Sci. USA, 83:4456, 1986) but has a homology of less than 75% with other members of the Vbeta 5 subfamily. IGR b 04 is, therefore, not a member of the Vbeta 5 subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Variable regions of b-chain of T-lymphocyte receptors and their DNA - useful as immuno:modulant(s) and for diagnosing immune disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 17.4; DB 13; Length 329;

The present invention provides the cDNA, protein and gene fragments of the human matrix metalloproteinase 13 (collagenase 3) (MMP13). Also provided are single nucleotide polymorphisms (SNPS) identified within the sequences. The sequences can be used to haplotype an individual and in the treatment of cancer and arthritis, including metastatic cancers. The present sequence is one version of the MMP13 cDNA, the gene for which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Note: The present sequence is stated as being the same as that shown as SEQ ID NO: 4 in the sequence listing of the specification. However, the sequences differ.

                                                       FFF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method for inhibiting expression of a target gene (ABL91658-ABL91797) in a cell by introducing at least one oligoribonucleotide that has a double-stranded structure consisting of at most 49 sequential nucleotide pairs, with at least part of one strand complementary with the target gene and has at least one end a single-stranded segment of 1-4 nt. The method provides oligoribonucleotides for antisense inhibition of gene expression useful e.g. for treating tumours but the oligoribonucleotides may also be directed against genes present in pathogens (e.g. Plasmodium or viruses/viroids, pathogenic on humans, animals or plants) or against cytokine, ild, develomental or prinon-genes. The method provides more effective inhibition of gene expression than use of known oligonucleotides, probably because the unpaired overhang increases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            XXXXXXXXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Growth factor; protein inhibitor; protease; damaged tissue; platelet derived growth factor; PGF; fibroblast growth factor; FGF; connective tissue derived growth factor; CTGF; chrysalni, VEGF; keratinocyte-derived growth factor; KGF; epidermal growth factor; EGF; transforming growth factor-beta; TGF-beta; matrix metalloproteinase; MMP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes transgenic mammals that express secondinant matriar-degrading enzymes (MDE) in a temporally and spatially regulated manner. The transgenic mammals produce phenotypic changes associated with cartilage-degenerative disease if maintained under conditions in which the recombinant gene is selectively expressed in joint tissue. The transgenic animal models are useful for determining the potential of a composition to counteract cartilage-degenerative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   disease. The present sequence encodes human matrix metalloproteinase 13 (MMP-13) which can be used as the recombinant MDE in a transgenic

The specification describes a pharmaceutical composition, comprising a growth factor, an inhibitor agent, i.e. a protease. The inhibitor agent, i.e. a protease. The inhibitor agent in a growth factor, that is upregulated in a damaged tissue such as a wound environment. Growth factors which are included in the composition of the invention are platelet-derived growth factor (PGF), fibroblast growth factor (FGF), connective tissue derived growth factor (CTGF), farathnocyte-derived growth factor (KGF), transforming growth factor (GFF), connective drowth factor (KGF), transforming growth factor (GFF), and chrysalin. Inhibitors which are included in the composition of the invention include inhibitors of urokinase-type plasminogen activator (UPA) and matrix metalloproteinase (MMP). The composition is useful for the treatment of chronic damaged tissue, i.e. wounds and dermal ulcers. The present sequence encodes a human construction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Composition for the treatment of damaged tissue i.e. chronic wounds and dermal ulcers comprises an inhibitor agent i.e. a protease and a growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cervical cancer; cytostatic; pre-malignant condition; gene therapy; ss.

The present invention describes transgenic mammals that express recombinant matrix-degrading enzymes (MDE) in a temporally and spatially regulated manner. The transgenic mammals produce phenotypic changes associated with cartilage-degenerative disease if maintained under conditions in which the recombinant gene is selectively expressed in joint tissue. The transgenic animal models are useful for determining the potential of a composition to counteract cartilage-degenerative disease. The present sequence represents a transgene with a tet07 promoter driving expression of a constitutively active human MMP-13 protein followeb by an SV40 splice and polyadenylation signal, where the transgene is designated Tet-07/MMP13*.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           note="this sequence contains introns. no stop codon"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
The invention relates to novel genes (AAH68727-AAH73383) associated with cervical cancer with cytostatic activity. The nucleic acids and encoded copypeptides are useful: to assess if a patient is afflicted with cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; matrix metalloproteinase 13; MMP-13; collagenase 3; cartilage; degenerative disease; matrix degrading enzyme; MDE; transgenic mammal;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hammatopoiesis regulating activity, issue growth factor activity, immunomodulatory activity and activity inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 25
